

Generalized morphisms – turning homological algorithms into closed formulas

M. Barakat¹

¹ *RWTH Aachen University, Aachen, mohamed.barakat@rwth-aachen.de*

Homological algebra has the reputation of being the theory of abstract notions and lengthy complex constructions. Generalized morphism is a new notion or rather “data structure” which turns many of these constructions into simple closed formulas, easily implementable on a computer. I will demonstrate two applications of constructive spectral sequences.
